July 2017

Nitish Shrivastava
Product Manager & Chief Architect, Marimba

Last month, we presented potential fix for reporting issues that all customers are hitting with...

➤ **Dependency on Inventory for Reporting**

- Patching, Policy and deployments triggers inventory scan for status validation
- Inventory doesn't 'only' picks status, a lot of additional data goes along
 - s/w usage, machine details, channels etc.
- Inventory plugin performance depends on load, data and resources
- **Aggressive inventory blocks queue while delayed inventory makes reporting off by days...**
- **Inventory is a bottle neck**

Marimba Reporting Framework

Enables customers to get better and close-to-real-time reporting, with a special focus on

- Assessing deployment success/failure rates (i.e. patching, policy deployments, etc..)
- Assessing agent health (i.e. integration with MaMoS module)
- Allowing customer-specific use cases to be enabled

Customers can

- Export and Schedule reports
- Locate Past and Current activities per machine or collection
- Extend the framework to collect custom alerts from endpoints

The Framework is

- Built on big data, can support any size data
- Extremely Optimized, powerful, secure and scalable
- Customizable

Logistics

Channels Updated

1. Transmitter
2. Policy Service,
3. Patch Service,
4. Inventory Service

New Components Added

1. Marimba Alert Service
2. Plugin
3. Event Viewer/Manager

New Components Added

1. Alert Collection (Logstash)
2. Alert Repository (Elastic, Cassandra)
3. Custom Alert Helper

Beta Version Available

1. Straight fit to existing Infra
2. Offers key use cases*

GA on 29th July

1. 9.x customers get all versions
2. 8.5 and 8.3 versions would be out on August 10th

Licensing Model

Considering problems with inventory, we are offering it **complimentary** to existing Marimba Customers

Implementation Assistance

- Support assistance available to all Marimba Customers
- 15 hours / 2 RFE per customer would be offered as 'complimentary service'
